Three Checkout Innovations Businesses Need to Know

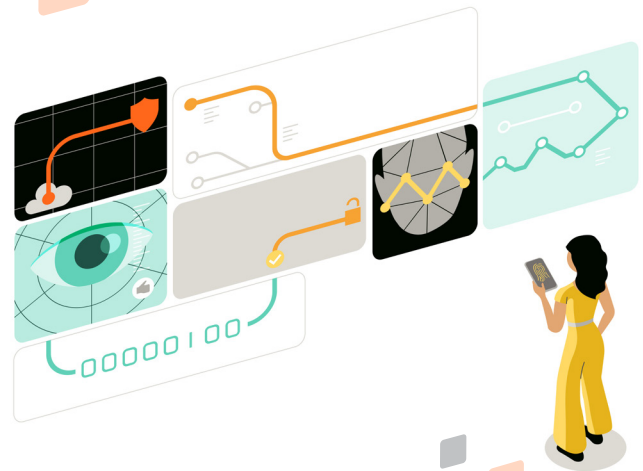

1 Click to Pay

No more manual card entry. Registered users simply need to look for the “Click to Pay” icon at checkout, prove their identity either via biometrics or a one-time code, and the payment is initiated. This makes checkout faster and more secure.

2 Paskeys

A safer and more convenient alternative to passwords, paskeys use a cryptographic key stored on your device to verify your identity instantly. Websites are increasingly offering paskeys as a log-in method, and they are also used to authenticate payments.

3 Agentic Payments

A paradigm shift may be on the horizon. Agentic payments envisage a new era of commerce, where AI agents autonomously and securely complete transactions. Emerging protocols blend tokenization and consent mechanisms to enable seamless, personalized shopping experiences.
